Sec
Managed SIEM

CORRELATE.

Utilize a Managed SIEM system to identify threats from across the infrastructure through centralized logging, automation, and analysis.
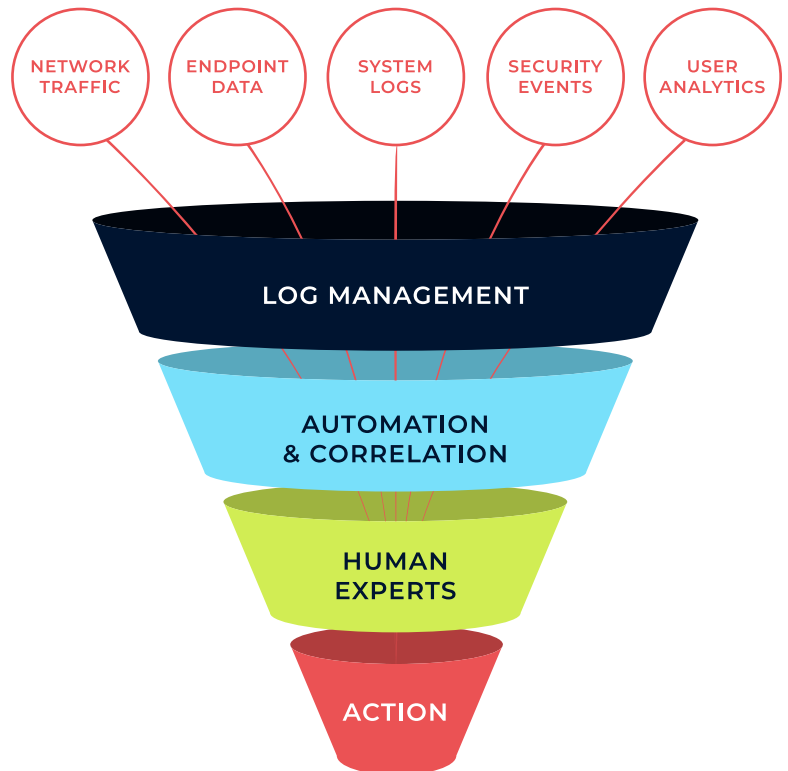

Information overload is real, but security shouldn't suffer because of it.

There is no question that system and application logs are important, but the amount of information produced by any one system is overwhelming — and rarely are they monitored proactively.

Correlating data between systems to find trends across the infrastructure is impractical to do by hand, even when centralizing all the logs. Automation and programmatic analysis is critical to finding threats in real-time.

Managed Security Information and Event Management (SIEM) relieves the burden of log collection and analysis by providing a real-time machine analysis of all log files that can identify and alert on suspicious activities. This allows customers to react quicker to time-sensitive security threats.

All this automation is backed by our 24/7/365 Security Operations Center (SOC), which is staffed by full-time security professionals who will review and deliver actionable data to your organization. Assigned project management and tier 3 engineering resources ensure a quick and thorough on-boarding process and time to value.

II:II SYSTEMS

Log management

Millions of logs are created, only a few matter.
Managed SIEM provides comprehensive event log management
that consolidates data from numerous sources. This enables
you to have a single view of all your security events.

Real-time monitoring

Seconds matter when you're detecting threats.
With Managed SIEM, you have real-time visibility into all
your infrastructure, applications, endpoints, and more to
detect threats. In addition, our experts are ready to analyze
and notify you about important issues and improvements.

Correlation and automation

Actionable insights from advanced analytics.
One of the biggest challenges in security management is reducing
time spent on low priority events (or "noise"). To ensure you act
quickly when it matters most, Managed SIEM analyzes disparate
security events to quickly correlate and make remediation
guidance through intelligent automation and expert analysis.

24/7/365 Support

Experts ready to support you every step of the way.
All security services include 24/7/365 support via our Security
Operations Center (SOC). Rely on our SOC analysts to provide
you with log analysis and reporting that makes sense and
delivers actionable data to secure your organization.
